- 1 Claims
- What is claimed, is:
- 3 1. A method of monitoring events in a computer network, the method comprising:
- 4 said computer network triggering said events, each event being provided with attribute
- 5 values allocated to a given set of attributes,
- 6 providing an event display with a cross plot having x and y coordinate axes, the x-axis
- 7 presenting a time period and the y-axis presenting an attribute value range,
- 8 determining a primary attribute of the events selected from the given set of attributes to
- be presented with its attribute values on the y-axis of the cross plot,

10

- allocating a first display label to the events indicating the attribute values of the primary
- attribute, providing a pattern algorithm to detect whether an arrived event is part of the
- given pattern on the basis of a comparison of the attributes allocated to the given pattern
- and of the attributes assigned to the arrived event, providing a mapping algorithm to map
- any attribute value of an attribute selected from the given set of attributes onto the y-axis
- of the cross plot,
- allocating a second display label to the events indicating the attribute values of the attrib-
- utes being uncovered as part of the given pattern, plotting all the events arrived within the
- time period and including an attribute value allocated to the primary attribute into the
- cross plot with the first display label indicating the primary attribute, the position of the
- 21 first display label of each event in the cross plot being determined on the basis of the
- attribute value of the primary attribute of the event and its arrival time, and
- plotting the all events arrived within the time period and being detected by means of the
- 24 pattern algorithm as part of the given pattern into the cross plot with the second display

- label indicating the given pattern, the position of the second display label of each event in
- 2 the cross plot being determined by the mapping algorithm on the basis of the attribute
- 3 value of the attribute of the event being uncovered as part of the given pattern and its
- 4 arrival time.
- 5 2. The method according to claim 1, further comprising:
- 6 recording the attribute values and the arrival time of a new event, determining on the
- basis of the recorded attribute values of event whether or not the newly arrived event
- 8 includes an attribute value of the primary attribute, and if the newly arrived event
- 9 includes the attribute value for the primary attribute shifting the x-axis of the cross plot so
- that the time period being presented on the x-axis covers the arrival time of the event, and
- plotting the event arrived within the shifted time period into the cross plot with the first
- display label indicating the primary attribute.
- 13 3. The method according to claim 2 comprising the further steps of:
- determining on the basis of the recorded attribute values of event whether or not the
- newly arrived event is part of the given pattern on the basis of a comparison of the attrib-
- utes allocated to the given pattern and of the attributes assigned to the arrived event,
- 17

22

- if the newly arrived event includes an attribute value of the given pattern adding the event
- to the previous events being detected as part of the given pattern, and
- redrawing all the events being associated with given pattern in the cross plot.
- 21 4. The method according to claim 3, further comprising:
- 23 if the newly arrived event does not include an attribute value of the given pattern,

- determining on the basis of the recorded attribute values of all previous arrived events by
- 2 means of the pattern algorithm whether or not the newly arrived event is part of a new
- pattern on the basis of a comparison of the attributes allocated to the new pattern and of
- 4 the attributes assigned to the arrived events;
- if the newly arrived event forms together with previous recorded events the new pattern,
- 6 allocating a third display label to the events indicating the attribute values of the attributes
- being uncovered as part of the new pattern; and
- 8 plotting the all events being detected by means of the pattern algorithm as part of the new
- 9 pattern into the cross plot with the third display label indicating the new pattern, the
- position of the third display label of each event in the cross plot being determined by the
- mapping algorithm on the basis of the attribute value of the attribute of the event being
- uncovered as part of the new pattern and its arrival time.
- 13 5. The method according to claim 1, further comprising:
- removing all the events including an attribute value allocated to the primary attribute
- from the cross plot, if a primary attribute to be presented with its attribute values on the
- y-axis of the cross plot is changed, allocating a fourth display label to the events indicat-
- ing the attribute values of the new primary attribute, and
- plotting all the events arrived within the time period and including an attribute value
- allocated to the new primary attribute into the cross plot with the fourth display label
- indicating the new primary attribute, the position of the fourth display label of each event
- 21 in the cross plot being determined on the basis of the attribute value of the primary attrib-
- 22 ute of the event and its arrival time.
- 23 6. The method according to claim 1 comprising the further steps of
- 24 plotting all attribute values recorded for an event with the respective display label into the

Docket Number: CH920020049US1 -20-

- 1 cross plot if the event is selected by an operator, and displaying textual information
- 2 associated with the selected event on the event display.
- 7. The method according to claim 1, wherein the pattern algorithm is suitable to
- 4 perform multi-attribute pattern recognition.
- 5 8. The method according to claim 1, wherein each display label includes a specific
- 6 color and/or a specific mark layout.
- 7 9. The method according to claim 1, wherein all events being uncovered as part of
- 8 the pattern are clustered by the corresponding display label.
- 9 10. A computer program containing a program code to carry out the steps of the
- method of claim 1, when the program code is running on a computer.
- 11 11. A computer program containing a program code to carry out the steps of the
- method of claim 1, said program code being stored on data carrier.
- 13 12. An event visualization device for monitoring events in a computer network, the
- device comprising means to perform the steps of the method as claimed in claim
- 15 1.
- 16 13. An article of manufacture comprising a computer usable medium having computer
- 17 readable program code means embodied therein for causing monitoring of events in a
- computer network, the computer readable program code means in said article of manufac-
- ture comprising computer readable program code means for causing a computer to effect
- the steps of claim 1.
- 21 14. A program storage device readable by machine, tangibly embodying a program of
- instructions executable by the machine to perform method steps for monitoring events in

- a computer network, said method steps comprising the steps of claim 1.
- 2 15. A computer program product comprising a computer usable medium having
- 3 computer readable program code means embodied therein for causing the event visualiza-
- 4 tion device, the computer readable program code means in said computer program
- 5 product comprising computer readable program code means for causing a computer to
- 6 effect the functions of claim 12.
